

User Manual

Detailed operating manual covering administration, procurement, warehousing, inventory, controls, and troubleshooting.

ProcuraFlow Professional Edition

Issued 11 August 2026

1. Accounts, Navigation, and Security

- ? Every user works through a named employee account linked to a role, department, approval limit, task permissions, report permissions, and permitted warehouses.
- ? Temporary passwords must be changed within the configured period. Password expiry and account lock controls are enforced.
- ? The sidebar shows only authorized functions. Direct API access is subject to the same permission checks.
- ? Dashboard tasks provide the operational queue; Live User Activity is restricted to authorized management.

2. Master Data Administration

Employees and Permissions

- ? Create the employee, assign department, position, role, reporting manager, and permitted warehouse.
- ? Review individual task and report assignments before saving.
- ? Provide generated credentials securely and restore locked access only after identity verification.

Items, Suppliers, and Locations

- ? Maintain unique codes, UOM conversions, reorder controls, inspection/batch/expiry flags, costs, and approval requirements.
- ? Maintain supplier identity, country, currency, terms, and performance information.
- ? Create each warehouse and its Zone, Rack, Shelf, and Bin hierarchy before stock transactions.

Company Settings

- ? Maintain company identity, logo, tax information, base currency, fiscal year, time zone, approval limits, and exchange rates.
- ? Back up before fiscal close or material configuration changes.

3. Purchase Requisitions

1. Open Purchase Requisitions and choose New PR.
2. Confirm requestor and department, then add items, quantities, required dates, and justification.
3. Attach evidence, save Draft if incomplete, or Submit for approval.
4. The approver reviews the complete document and approves or rejects it.
5. An approved PR remains Submitted until all quantity is converted to PO or an authorized manager closes the balance.

4. RFQ, Quotations, and Purchase Orders

1. Create an RFQ from approved demand and invite appropriate suppliers.
2. Capture quotation price, freight, tax, currency, lead time, terms, warranty, and quality evidence.
3. Select the justified quotation after comparison.
4. Create a PO from one or more submitted PRs; matching items may consolidate while PR balances remain traceable.
5. Confirm committed delivery date and commercial totals, then submit.
6. Complete delegated approval; attach external evidence where the amount exceeds internal authority.
7. Print the approved PO. Printed POs are locked and available for receiving.

5. Goods Receipt and PO Closure

1. Select an approved or printed open PO in Goods Receipt.
2. Confirm supplier, committed date, assigned warehouse, outstanding lines, approved cost, and tax.
3. Enter delivery note and received/accepted/rejected quantities; accepted plus rejected must equal received.
4. Record destination Bin, batch, expiry, and rejection reason where applicable.
5. Post and print the GRN. Accepted quantity creates FIFO inventory.
6. Repeat for partial deliveries; the PO closes only when every ordered line is fully accepted.

6. Inventory Movements

Material Issue and Return

- ? Issue available quantity to a named employee for a stated purpose. Controlled issues route to approval.
- ? Return against original responsibility and record quantity and condition.

Transfers and Adjustments

- ? Use Warehouse Transfer for inter-warehouse movement and Bin Transfer for internal relocation.
- ? Use Stock Adjustment only with a mandatory reason and manager approval.
- ? Correct posted errors through a new controlled transaction; posted ledger entries remain immutable.

Cycle Count and Tools

- ? Enter physical quantities, review variance, and submit cycle counts to an independent approver.
- ? Track returnable tools by unique ID, serial, issue employee/date, return date, and condition.

7. Invoice and Finance Verification

1. Register the unique supplier invoice against an eligible fully received PO and its posted GRNs.
2. Review PO value, accepted GRN value, invoice total, tax, and system variance classification.
3. If source PO and GRN values differ, correct the source discrepancy through an authorized workflow.
4. For an eligible variance, the Supply Chain Manager records the controlled reason, adjustment, acceptance note, and supporting evidence.
5. Submit to Finance only when controls pass and the remaining difference is zero. Original source values remain unchanged.

8. Reporting

- ? Procurement reports cover PR, RFQ, quotation comparison, PO register, open orders, aging, delivery performance, supplier purchases, price variance, and Finance verification.
- ? Warehouse and inventory reports cover receipts, issues, returns, transfers, adjustments, stock ledger, balances, FIFO, batches, expiry, low stock, cycle counts, consumption, returnables, and tools.
- ? Executive and administration reports cover commitments, supplier performance, approval turnaround, inventory exposure, user activity, and employee permissions.

9. Backup, Audit, and Troubleshooting

- ? Create controlled backups before month-end, fiscal close, restore, repair, or major configuration changes.
- ? Run `npm run audit:db` from backend when integrity or stock consistency must be verified.
- ? If a page is unavailable, confirm the employee role and individual task/report assignment.
- ? If a warehouse or Bin is unavailable, confirm employee warehouse assignment and location hierarchy.
- ? If a transaction is blocked, read the validation message and correct the source data; never weaken controls or edit the database directly.
- ? For service issues, verify backend health at <http://localhost:4000/api/health> and frontend access at <http://localhost:5173>.

10. Status Reference

- ? Draft: editable and not yet submitted.
- ? Submitted: requisition approved and awaiting conversion, or document submitted as defined by its workflow.
- ? Pending Approval: awaiting an authorized decision.
- ? Approved: authorized but not necessarily posted.
- ? Printed: approved PO locked and open for receipt.
- ? Posted: inventory updated and transaction immutable.
- ? Rejected: decision declined with retained history.
- ? Closed: workflow completed with no remaining operational balance.
